

Date

19<sup>th</sup> June  $\rightarrow$  June (assignment)

Saathi

# ① Assignment:

Eg: 10, 13, 18, 22, 27, 32, 38, 40, 45, 51, 56, 57, 88, 90, 92, 94, 99

bin size = 20, H of bins is '5'

of test - Assignment

② Quant test of CAT exam

$$\sigma = 100$$

$$\text{sample}(n) = 25$$

$$(\bar{x}) = 520$$

construct an 80% CI about the mean

Higher / Lower fence = Point estimate  $\pm$  margin of error.

$$= \bar{x} \pm Z_{\alpha/2} \times \frac{\sigma}{\sqrt{n}}$$

$\alpha$  = significance value

$$1 - C.I. = \alpha$$

$$1 - 0.8 = 0.2$$

$$= 520 \pm Z_{0.2/2} \times \frac{100}{\sqrt{25}}$$

$$= 520 \pm Z_{0.1} \times \frac{100}{5}$$

$$= 520 \pm \left( 1.28 \times \frac{100}{5} \right)$$

$$= 520 \pm 25.6$$

$$\text{Lower fence} = 494.4$$

$$\text{Higher fence} = 545.6$$

④ Data set:

2, 2, 3, 4, 5, 5, 5, 6, 7, 8, 8, 8, 8, 8, 9, 9, 10, 11, 11, 12

$$n = 20,$$

$$99^{\text{th}} \text{ percentile} = 99 \cdot \frac{(n+1)}{100}$$

$$= 20.79^{\text{th}} \text{ index.}$$

So, the 99<sup>th</sup> percentile is 12,

⑤ Left skewed - negatively skewed

As the distribution is left skewed, the mean will be the lowest, because the lesser numbers pull the mean towards them so,

$$\bar{x} < M < Z.$$

③ Right skewed distribution: - Positively skewed

As the distribution is positively skewed, the higher values present in the distribution tends to pull the <sup>mean</sup> value towards right, so,

$$\underline{Z < M < \bar{X}}$$
